

## Resistance-Temperature Tables

NTC (Negative Temperature Coefficient) is the negative Percent resistance change per degree C. To determine The resistance tolerance of a precision thermistor at any times the NTC.

As an example, a Curve A thermistor with a temperature Tolerance of  $\pm 1^\circ\text{C}$  over the temperature range  $0^\circ$  to  $70^\circ\text{C}$  would have the following resistance tolerance:  
 $0^\circ\text{C} = \pm 5.1\%$ ;  $25^\circ\text{C} = \pm 4.4\%$ ;  $70^\circ\text{C} = \pm 3.4\%$

$R_T/R_{25}$  Ratio is the resistance at temperature divided

by the resistance at  $25^\circ\text{C}$ . To determine the resistance at other temperature points, multiply the coefficient by the  $R_{25}$  value.

Ratio TOL(Tolerance) is the resistance tolerance at a temperature point due to slope variance from the nominal R-T Curve. This tolerance applies to thermistors point-Matched to a single temperature point. The ratio tolerance is added to the percent resistance tolerance at the point-Matched temperature.
